

PREFERRED PREFEED DEVICES

For use with the Multicor, the preferred prefeed devices are screw and/or rotary feeders.

SCREW FEEDERS

Screw feeders offer more flexibility for plant layout, since length and angle are adjustable to the requirements. They also offer a higher turndown ratio than rotary feeders.

ROTARY FEEDERS

The cost of rotary feeders, in most cases, is less and they are more compact and have a lower power rating. In applications with pressure differentials exceeding ± 5 mbar, a rotary feeder above the Multicor is **required** and a rotary valve below the Multicor is also required.

CONSTANT MATERIAL FLOW

The use of a prefeed device insures that a constant material flow (without any pulsing) to the Multicor is maintained.
